The purpose of this article is to analyze the improvement of road safety on the basis of data, concerning accidents and collisions in the area of two municipalities in the Mazovian Voivodeship, in which bypasses of county towns in the course of expressways have been built (the municipality of Wyszaków and the municipality of Garwolin). The study was conducted on the basis of data contained in accident cards, collected by the Traffic Bureau of the Police Headquarters within the Accident and Collision Record System (SEWIK), for the years 2006-2012. The Mazowieckie Voivodeship, in terms of the level of accidents, slightly deviates from the national average.
